DOING IT DIFFERENTLY

WHAT IS A VPN?

What Is It?

A Virtual Private Network (VPN) creates a secure, encrypted connection over the internet between your devices and a private network. It acts as a shield, keeping your online activities private and protecting sensitive data from cyber threats.

Secure Remote Acess

In today's remote work environment, employees need access to company resources from anywhere. A VPN ensures they can connect to your internal systems safely, without exposing your business to cyber risks.

Data Encryption

Every time your employees send or receive data, a VPN encrypts that information, making it unreadable to hackers or unauthorised users. This is crucial when handling confidential customer details, financial data, or intellectual property.

More Privacy

A VPN hides your company's IP address, ensuring that your internet activities remain private. It makes it harder for attackers to track your online behaviour or target your business for cyberattacks.

Protection on Public WiFi

A VPN hides your company's IP address, ensuring that your internet activities remain private. It makes it harder for attackers to track your online behaviour or target your business for cyberattacks.
